                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents part of the genome of a fulminant Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the genotypes A to F) in at least two of the enhancer I region, the negative regulatory element region, the enhancer II/ core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the peptide amino acid change to Cys or Met. The HBV variants of the proteins and HBV nucleic acid. Probes that hybridise to any of the proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease, specified mutated regions are used to detect HBV-related disease. Secologically unusual forms of disease. Combinations of the specified mutations are associated with fullminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.

especially fulminant infection, but also severe chronic infection or serologically unusual forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell
                                                                                                                               The present sequence represents part of the genome of a fulminant Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the genotypes A to F) in at least two of the enhancer I region, the negaliatory element region, the enhancer II core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the invention are used to detect binding interactions between host or viral proteins and HBV nucleic acid. Probes that hybridise to any of the processing and regions are used to detect HBV-related disease.
- useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.

```

The present sequence represents part of the genome of a fulminant Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the regulatory element region, the enhancer I region, the negative sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect they-related disease, especially fullminant infection, but also severe chronic infection or serologically fullminant forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell Sequence 1500 BP; 305 A; 408 C; 349 G; 438 T; 0 U; 0 Other;

New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.

```
The present sequence represents part of the genome of wild type Hepatitis B virus genotype D, nucleotides 1000 to 2500. Mutations occur in this region in fullminant hepatitis B virus (FRBV) patients. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the genotypes A to F) in a least two of the enhancer I region, the negative regulatory element region, the enhancer II/ core upstram regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the invention are used to change to Cys or Met. The HBV variants of the specified mutated regions are used to detect HBV-related disease, especially fulminant incleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease, especially fulminant forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fulminant hepatitis B virus; variant; FHBV; HBV; binding interaction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present sequence represents part of the genome of a fulminant Hepatitis B virus (FHBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) mucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the genotypes A to F) in at least two of the enhancer I region, the negative regulatory element region, to a mutation which leads to any sequence, basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the invention are used to detect binding interactions between host or viral proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease, especially fulminant infection, but also severe chronic infection or especially unusual forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell
                                                                                                                                         New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1500 BP; 314 A; 403 C; 343 G; 440 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis B virus (FRBV) genotype D variant, nucleotides 1000 to 2500. The specification describes Hepatitis B virus (HBV) nucleic acid that has a mutation (i.e. alteration from the normal nucleotide in any of the genotypes A to P) in at least two of the enhancer I region, the negative regulatory element region, the enhancer II/ core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. The HBV variants of the Invention are used to detect binding interactions between host or viral proteins and HBV nucleic acid. Probes that hybridise to any of the specified mutated regions are used to detect HBV-related disease, especially fulminant infection, but also severe chronic infection or serologically unusual forms of disease. Combinations of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell
                                                                                                                                                                                                                                                                                                                                                                                           New hepatitis B virus nucleic acid with combination of specific mutations - useful for, e.g. detection of binding interactions between host or viral proteins and HBV nucleic.

```
/clone libe Xenotes tropicalis xthr plasmid library"
/clone libe Xenotes tropicalis poly4. RNA was obtained from
fili, Xenopus tropicalis poly4. RNA was obtained from pool
of heads and retinas from tailbud stages 25-35 cDNAs were
synthesized using the SMART system of CLONTECH and
directionally cloned into prowysporre_xthr, a modified
version of pCWNSPORTE allowing directional cloning using
asymetric Sfil sites. For antisense RNA synthesis, use T7
promoter and for sense RNA use SP6 promoter. Library
constructed by Drs. N. Pollet, M. Perron, M. Wegnez,
Mazabraud (CNRS UMR 8080, Universite Paris Sud, Orsay,
Sfil; Xenopus tropicalis polyA+ RNA was obtained from brain and spinal cord of tadpoles at stages 51-52 and 61-62. cDNAs were synthesized using the SNART system of CLONTECH and directionally cloned into pCWNSPRT6 xtbs, a modified version of pCWNSPORT6 allowing directional cloning using asymetric Sfil sites. For antisense RNA synthesis, use 77 promoter and for sense RNA apymentels, use 77 promoter and for sense RNA apymencer. Library constructed by Dr. L. Coen and Prof. B. Demeneix (Museum National d'Histoire Naturelle and CNRS UMR 5166, Paris, France)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Xenopodinae; Xenopus; Silurana.

/note="Organ: pooled testis, Vector: pT-Advantage, cDNA
was synthesized from adult testis and ovary total RNA
using SMART PCR cDNA synthesis kit (Clontech).
PCR-SelectTM cDNA subtraction kit (Clontech) was used to
enrich for fragments, which were present in the testis but
not in the ovary cDNA. The selectively amplified cDNA
fragments (in average 400-800bp in length) were ligated
into pT-Advantage (Clontech) and transformed into
xL10-Gold competent cells (Stratagene). The insert from
randomly selected white colonies was PCR amplified using
M13 forward and reverse primers and partially sequenced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Xenopus tropicalis

Zorn.
CDNA was oligo dT primed from Sug of poly A+ RNA from neurula.
ECORT-NotI cut CDNA was then ligated into pCS107 with ECORI at 5' end and NotI at the 3' end.

Sanger Xenopus tropicalis EST project 2001
TROPICALIS_SEQUENCE ID: TNeu111c20.q1kT7
Sequencing primer: T7
This sequence is from a Xenopus Gene Collection (XGC) library
constructed by Aaron M. Zorn.
CDNA was oligo dT primed from Sug of poly A+ RNA from neurula.
ECORI-NotI cut cDNA was then ligated into pCS107 with ECORI at the
5' end and NotI at the 3' end.
Vector: pCS107; Site 1: ECORI; Site_2: NotI
Host: Escherichia coli DH10B.

Zorn.

CONSTRUCTED OF PRIMED FROM FOR THE CONT.

CDNA was oligo dT primed from 5ug of poly A+ RNA from neurula.

ECORT.NotI cut cDNA was then ligated into pCS107 with EcoRI at the 5' end and NotI at the 3' end.

Vector: pCS107; Site_1: ECORI; Site_2: NotI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Clone lib="Zebrafish Research Genetics C32 fin"
// note="Vector: pT71D-Pac with a modified polylinker;
Site_1: ScoRi, Site_2: NotI; lst strand cDNA was prepared
from Zebrafish (G32) fin, and was then primed with a Not I
- oligo(dT) primer. Double-stranded cDNA was ligated to
Eco RI adaptors (Pharmacia), digested with Not I and
cloned into the Not I and Eco RI sites of the modified
pT7T3 vector. Library is non-normalized. Library was
constructed by Ning Wu. NOTE: This clone is available
royalty-free through LiNL; contact the IMAGE Consortium
(info.llnl:gov) for further information"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                    Laboratory Mouse DNA Resource
[http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwb22 (gi|4732114|gb|AR129072.1) a copy-number inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent B. coli Xi10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: pBluescript SK-; Site_1: ECORI; Site_2:
Xhot; Immature seeds, collected from pods ranging in age
from 25 to 35 days after pollination, were harvested from
greenhouse-grown plants. Seed were removed and separated
from pod walls and immediately frozen in liquid nitrogen.
Seeds throughout the age range were pooled for mRNA
extraction. CDNA was prepared from polyA+ enriched RNA.
The CDNA was directionally ligated into the Unizap XR
vector from Stratagene and packaged using Giappack III
Gold packaging extracts. Plasmids containing cDNA inserts
were excised from the recombinant lambda-Zap phage using
Ex-assist helper phage and propagated in XLOLR cells."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         537 bp mRNA linear EST 24-FEB-2004 eca01-43mg3-f11 Eca01 Eschscholzia californica cDNA clone eca01-43mg3-f11 5', mRNA sequence.

//note="Vector: pT713D-Pac with a modified polylinker;
Site_1: ECORI; Site_2: NotI; lst strand cDNA was prepared
from zebrafish (C12) fin, and was then primed with a Not I
- oligo(dT) primer. Double-stranded cDNA was ligated to
ECO RI adaptors (Pharmacia), digested with Not I and
Cloned into the Not I and ECO RI sites of the modified
pT7T3 vector. Library is non-normalized. Library was
constructed by Ning Wu. NOTE: This clone is available
royalty-free through LiML; contact the IMAGE Consortium
(info.llnl.gov) for further information"

Inote="Organ: leaf; Vector: pBCSK(-); Site_1: HincII; DNA prepared from purified nuclei was randomly sheared, def-repaired, size fractionated to enrich for the 0.5 to 5 kb fraction, ligated into HincII-digested pBCSK(-) vector and electroporated into E. coli cells. This is a methylation-filtered library."

The library was characterised by oligonucleotide fingerprinting
(ONF) to reduce sequencing redundancy. According to the ONF
procedure, clones that display the same hybridisation matrix with a
battery of 200 8mer oligonucleotides are grouped into clusters. One
clone per ONF cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
analysed library. The cluster size as well as the coordinates of
the other clones assigned to the same ONF cluster as the clone from
which the above BST is generated is available at the sea urchin
project web site at: http://www.molgen.mpg.de/ag_seaurchin/. cDNA
Clones and filters are distributed via the Resource Center/Primary
Database of the German Human Genome Project (http://www.rzpd.de)

Clones are derived from the human BAC library RPCI-11. For BAC
library availability, please contact Pieter de Jong
(pieter@dejong.med.buffalo.edu). Clones may be purchased from
BACPAC Resources (http://bacpac.med.buffalo.edu/ordering) or from
Research Genet cs (info@resgen.com). BAC end search page:
http://www.tigr.org/tdb/humgen/bac_end_search/bac_end_search.html.
This BAC end was generated during the R&D process and may have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         / Jesue L'Equato.

Subtraction was made according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The oligonucleotide used to prime the synthesis of first-strand conds contains a library tag sequence that i located between the Not I site and the (dr)18 tail. The sequence tags for these libraries are: CTAATGGACG,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             'clone_lib="Sorghum methylation-filtered library (LibID:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
